Question 1

Mirror Descent and Continuous Exponential Weights

In this exercise we look at Online Gradient Descent on $U = \mathbb{R}^d$, i.e. without any projections. Then Online Gradient Descent plays iterates $w_1 = 0$ and

$$w_{t+1} = w_t - \eta \nabla f_t(w_t) \tag{1}$$

Subquestion 1.1

Show that the OGD iterate w_{t+1} is the minimiser of the problem

$$\min_{w \in \mathbb{R}^d} \langle w, \nabla f_t(w) \rangle + \frac{1}{2\eta} ||w - w_t||^2.$$

Solution

Let's define a function $g: \mathbb{R}^d \to \mathbb{R}$:

$$g(w) = \langle w, \nabla f_t(w_t) \rangle + \frac{1}{2\eta} ||w - w_t||^2$$

= $w_1 \frac{\partial f_t}{\partial w_1} (w_t) + \dots + w_d \frac{\partial f_t}{\partial w_d} (w_t) + \frac{1}{2\eta} \left((w_1 - w_{t1})^2 + \dots + (w_d - w_{td})^2 \right)$

We would like to find an extreme point, so $\frac{\partial g}{\partial w_i}(w^*) = 0$; $\forall i \in \{1, \dots, d\}$.

$$\frac{\partial g}{\partial w_i} = \frac{\partial f_t}{\partial w_i}(w_t) + \frac{1}{\eta}(w_i - w_{ti})$$

$$\Rightarrow w_i^* = w_{ti} - \eta \frac{\partial f_t}{\partial w_i}(w_t)$$

$$\Rightarrow w^* = w_t - \eta \nabla f_t(w_t)$$

$$\Rightarrow \qquad w^* = w_t - \eta \nabla f_t(w_t)$$

To show that calculated extreme is a minimum, we are going to show that g is a convex function.

$$\begin{split} \frac{\partial^2 g}{\partial w_i \partial w_i} &= \frac{1}{\eta} \\ \frac{\partial^2 g}{\partial w_i \partial w_j} &= 0; \quad i \neq j \end{split}$$

The second derivative of g is non-negative for every $w \in \mathbb{R}^d$, therefore it is convex.

Subquestion 1.2

Next we look at Exponential Weights (with learning rate η) on the continuous space \mathbb{R}^d . We start with the spherical Gaussian prior density

$$p_1(u) = (2\pi)^{-d/2} e^{-\frac{||u||^2}{2}}$$

and we update the density using the exponential weights update

$$p_{t+1}(u) = \frac{p_t(u)e^{-\eta\langle u, \nabla f_t(w_t)\rangle}}{normalisation}$$

where we change each point $u \in \mathbb{R}$ the linearized loss $\langle u, \nabla f_t(w_t) \rangle$ (and not the actual loss $f_t(u)$). Let $\mu_t = \int_{\mathbb{R}^d} u p_t(u) du$ be the mean of p_t . Let w_t be the iterates of Online Gradient Descent (1). Show that $\mu_t = w_t$ for all t.

Solution

In the following calculations we used two known integrals:

$$\int_{-\infty}^{\infty} x e^{-ax^2 + bx} dx = \frac{\sqrt{\pi b}}{2a^{3/2}} e^{\frac{b^2}{4a}}; \quad (\text{Re}(a) > 0)$$

$$\int_{-\infty}^{\infty} e^{-ax^2} dx = \frac{1}{2} \sqrt{\frac{\pi}{a}}; \quad (a > 0)$$

$$\int_{\mathbb{R}^{d}} u p_{1}(u) du = \int_{\mathbb{R}^{d}} u (2\pi)^{-d/2} e^{-\frac{||u||^{2}}{2}} du$$

$$= (2\pi)^{-d/2} \int_{\mathbb{R}^{d}} u e^{-\frac{u_{1}^{2} + \cdots u_{d}^{2}}{2}} du$$

$$= (2\pi)^{-d/2} \left(\int_{-\infty}^{\infty} \cdots \int_{-\infty}^{\infty} u_{1} e^{-\frac{u_{1}^{2} + \cdots u_{d}^{2}}{2}} du_{1} \dots du_{d}, \dots, \dots, \dots, \dots, \dots \right)$$

$$\int_{-\infty}^{\infty} \cdots \int_{-\infty}^{\infty} u_{d} e^{-\frac{u_{1}^{2} + \cdots u_{d}^{2}}{2}} du_{1} \dots du_{d} \right)$$

 $= \frac{(2\pi)^{-d/2}}{N_1 \cdots N_t} \int_{\mathbb{R}^{d-1}} \left(\int_{-\infty}^{\infty} u_k \ e^{-1/2 \sum_{j=1}^d u_j^2} \ e^{-\eta \sum_{i=1}^t \langle u, \nabla f_i(w_i) \rangle} du_1 \right) du_2 \dots du_d$

$$= \frac{(2\pi)^{-d/2}}{N_1 \cdots N_t} \int_{\mathbb{R}^{d-1}} u_k \, e^{-1/2 \sum_{j=2}^d u_j^2} \, e^{-\eta \sum_{i=1}^t \sum_{j=2}^d u_j \cdot \frac{\partial f_i}{\partial u_j}(w_i)} \left(\int_{-\infty}^\infty e^{-1/2u_1^2} \, e^{-\eta \sum_{i=1}^t u_1 \cdot \frac{\partial f_i}{\partial u_1}(w_i)} du_1 \right) du_2 \dots \\
= \frac{(2\pi)^{-d/2}}{N_1 \cdots N_t} \int_{\mathbb{R}^{d-1}} u_k \, e^{-1/2 \sum_{j=2}^d u_j^2} \, e^{-\eta \sum_{i=1}^t \sum_{j=2}^d u_j \cdot \frac{\partial f_i}{\partial u_j}(w_i)} \left(\sqrt{2\pi} e^{\eta^2 (\sum_{i=1}^t \frac{\partial f_i}{\partial u_j}(w_i))^2} \right) du_2 \dots du_d \\
= \frac{(2\pi)^{-d/2}}{N_1 \cdots N_t} \left((\sqrt{2\pi})^{d-1} e^{\eta^2 \sum_{j=1, j \neq k}^d (\sum_{i=1}^t \frac{\partial f_i}{\partial u_j}(w_i))^2} \right) \int_{-\infty}^\infty u_k \, e^{-1/2u_k^2} \, e^{-\eta \sum_{i=1}^t u_k \cdot \frac{\partial f_i}{\partial u_k}(w_i)} du_k \\
= \frac{(2\pi)^{-1/2}}{N_1 \cdots N_t} \left(e^{\eta^2 \sum_{j=1, j \neq k}^d (\sum_{i=1}^t \frac{\partial f_i}{\partial u_j}(w_i))^2} \right) \left(\frac{\sqrt{\pi}(-\eta) \sum_{i=1}^t \frac{\partial f_i}{\partial u_k}(w_i)}}{2\frac{1}{2\sqrt{2}}} e^{-\eta \sum_{i=1}^t \frac{\partial f_i}{\partial u_k}(w_i)^2} \right) \\
= \frac{1}{N_1 \cdots N_t} \left(e^{\eta^2 \sum_{j=1}^d (\sum_{i=1}^t \frac{\partial f_i}{\partial u_j}(w_i))^2} \right) \left((-\eta) \sum_{i=1}^t \frac{\partial f_i}{\partial u_k}(w_i) \right) \\
= \frac{1}{N_1 \cdots N_t} \left(e^{\eta^2 \sum_{j=1}^d (\sum_{i=1}^t \frac{\partial f_i}{\partial u_j}(w_i))^2} \right) \left((-\eta) \sum_{i=1}^t \frac{\partial f_i}{\partial u_k}(w_i) \right) \right)$$

Question 2

Strongly Convex Online To Batch Conversion

Subquestion 2.1

Consider loss functions of the form $f_t(u) = \frac{1}{2}(u - y_t)^2$ for $u, y_t \in \mathbb{R}$. Show that f_t is strongly convex for degree $\alpha = 1$.

Solution

For strongly convex function f it holds:

$$f(y) \geq f(x) + \langle y - x, \nabla f(x) \rangle + \frac{\alpha}{2} ||x - y||^2$$

Since, in our case $\alpha = 1$ and $f_t : \mathbb{R} \to \mathbb{R}$, we need to prove for any $u_2, u_1 \in \mathbb{R}$ the following:

$$f_t(u_2) \ge f_t(u_1) + (u_2 - u_1) \cdot f_t'(u_1) + \frac{1}{2}(u_1 - u_2)^2; \quad f_t'(u) = u - y_t$$

So:

$$\frac{1}{2}(u_2 - y_t)^2 \ge \frac{1}{2}(u_1 - y_t)^2 + (u_2 - u_1)(u_1 - y_t) + \frac{1}{2}(u_1 - u_2)^2$$

$$(u_2 - y_t)^2 \ge (u_1 - y_t)^2 + 2(u_2 - u_1)(u_1 - y_t) + (u_1 - u_2)^2$$

$$u_2^2 - 2u_2y_t + y_t^2 \ge u_1^2 - 2u_1y_t + y_t^2 + 2u_1u_2 - 2u_2y_t - 2u_1^2 + 2u_1y_t + u_1^2 - 2u_1u_2 + u_2^2$$

$$0 > 0$$

Subquestion 2.2

Construct an estimator $\hat{w}_T(y_1, \dots, y_T)$ (by online to batch conversion) and show that its excess risk is at most

$$\mathbb{E}_{y_1,\dots,y_T,y}\left[\frac{1}{2}\left(\hat{w}_T(y_1,\dots,y_T)-y\right)^2-\frac{1}{2}(u^*-y)^2\right] \leq \frac{1+\ln T}{2T}$$
